Collecting Triassic Ammonites in Northeastern Nevada

Not much to this one, unfortunately. Only a few pictures of the last spot that we stopped on this trip. We actually spent most of the day out looking for various other elusive fossils, brittlestars in particular, but since we got skunked we decided to hit this more than popular site. My Grandpa says that when he first collected here the ammonites were so plentiful that it only took a few minutes to collect all that you needed. That was 30 or 40 years ago. It has been picked over plenty since then and this time, the pickings were not as good. There are still ammonites to be found, as you can see, but they required a little more work than they used to. Here is another [link](#) to information about this location. It is much more informative, and includes a lot of information about the area. Including details about the geology.
